

Prominence Metric Management

Establish a strong data governance framework to achieve data maturity.

Metric management offers a powerful solution to modern health systems' data governance problems by providing a structured approach to data governance.

Proper metric management ensures that your team is working with trusted data, giving you confidence in your reporting and allowing you to efficiently utilize existing metrics when able.

Metric Management Maturity Levels

Your organization's current maturity will determine our starting point for developing metric maturity.

1 Standardized

- Your Analytics Team is aware of current state metric management deficiencies.
- It's understood that centralizing metric definitions can save time and be leveraged for future projects.

2 Centralized

- Formalized requirements for consistent capture of metric definition during analytics life cycle.
- Culture or organizational barriers place the ownership of capturing and documenting on the Analytics Team.

3 Simplified

- Organizational support to standardize on terminology and reuse across data requests, but Analytics Team is driving the effort.
- Technology implemented, but not ubiquitously used.

4 Organized

- Across the organization, data domains are viewing and using standard terminology through the enterprise Business Glossary.

5 Systematized

- Metrics are transparent to all users, tying owners to business definition as well as technical database lineage.
- The business is driving the curation efforts for standard terminology.

Metric Life Cycle

Our team of experts will use best practices for managing and documenting metrics to complete a metric workbook, which will act as your source of truth for metric definition and ownership. The steps of the metric life cycle include:

Technologies Involved:

1	Define Goal			
2	Define Populations			
3	Document Metrics and Ownership			
4	Review Metric Management Application			
5	Gather Technical Definition			
6	Relationship to Dimensions			
7	Whiteboard and Approval			
8	Data Modeler Creates or Reuses Global Transforms in SQL			
9	Update Configuration			
10	Create UI Variables			
11	Validate Data			
12	Review Final Definitions in Workbook
