Readmissions

Tracking the number of patients who experience unplanned readmissions to a hospital after a previous hospital stay is a category of data used to judge the quality of hospital care. Depending on the reporting source, readmissions are defined as any admission to the same hospital occurring within a certain number of days after discharge from the initial visit. The Centers for Medicare & Medicaid Services (CMS) defines hospital readmission as patient admission to a hospital within 30 days after being discharged from an earlier hospital stay. Rates at the 80th percentile or lower are considered optimal by CMS.

Our Readmissions Review application allows you to easily analyze common causes for readmission using the industry standard CMS definitions. You can use this application to initiate quality improvement efforts to focus on the care of your hospital patients while in the hospital as well as improvement efforts focused on effective and safe discharge plans. Good discharge plans can help reduce the rate of unplanned readmissions by giving patients the care instructions they need after a hospital stay and by helping patients recognize symptoms that may require immediate medical attention.
