

Prominence Extraction Console

Optimize and govern the delivery
of your data

Healthcare organizations today have more data coming from more sources than ever before. Being able to quickly move that data from disparate systems to analytics team members in an efficient and governable manner is critical to the success of your data-dependent initiatives.

Prominence's Extraction Console is a code-free solution that allows you to optimize how you get data from disparate sources via incremental loads, indexing, and more; while enabling governance over those extractions to ensure you're only extracting data once. Simply enter credentials for the source database, specify the data you'd like to extract, and set your schedule for recurring refreshes. Prominence's Extraction Console will then automatically:

- Write extraction code and deliver it for your servers to run
- Re-run data extractions on the set schedules that you determine

Ready to get started? Contact Prominence today for a no-strings conversation about how to get started on this project this month!

Key Features

- Secure instance of Prominence's Extraction Console for your organization
- Education for key team members on how to use the Extraction Console
- View edit history of extraction tasks, including who made what changes and when
- Rollback to a previous task state
- View history of deployments to validation and production environments as they differ from the current state
- Rollback to a previous deployment

Additional Notes

- Prominence's Extraction Console never removes data from your environments
- Prominence's Extraction Console supports custom SQL for data extractions to ensure every potential data need can be accommodated
