Epic Enterprise Data Catalog

View lineage and immediately understand downstream impacts to database changes from upgrades or data pipeline changes

A Better Solution

Healthcare organizations have historically struggled to rapidly upgrade their systems. This isn't due to lack of talented staff or a desire to rollout new features, but due to needing to understand all the impacts of the upgrade, especially around data. One of our customers spent **more than 30 days** understanding all impacts of a single field change during upgrade.

Prominence and Informatica have partnered to create an Enterprise Data Catalog that automatically scans data sources (Clarity, Caboodle, Infor, Peoplesoft, and more), data transformations, and data visualizations to provide an end-to-end view of data lineage and use throughout the enterprise.
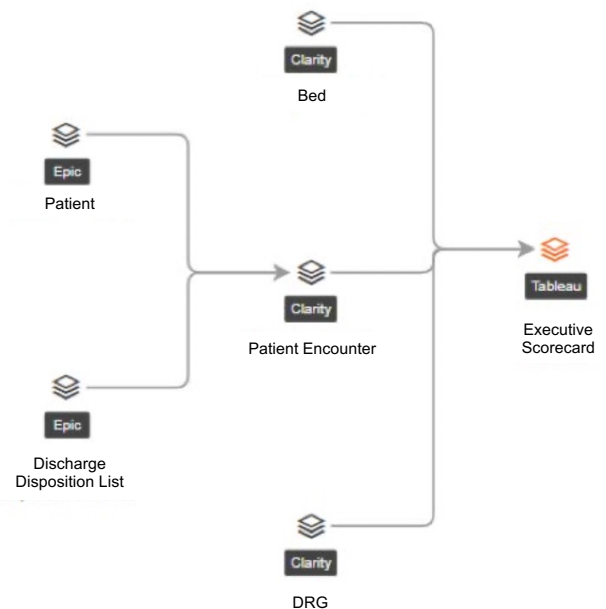

We implemented the solution in **less than 30 days**, and the customer now spends **less than 3 minutes** assessing data changes during upgrades and have since made the data catalog available to consumers throughout the organization.

Path Forward

This is just one use case that is **saving more than $324,000 per year**. The Enterprise Data Catalog can also be used increase data literacy and create a Google-like search engine for data assets. This is a fundamental building block to start taming the wild-west of reporting tools and visualizations that proliferate at organizations across the nation.

99%

Reduction in Time Spent Analyzing Database Impacts
